

This is an attempt to bring most of the accepted Exceptional bird records for Tulare County into one place. This is not an attempt to legitimize or reject records.

Exceptional: vagrant, wanderer, locally extirpated species, very locally Rare species

"?" is not a questioning of authenticity but of missing data or data that is only vaguely remembered.

Most of the good information comes from Bob Barnes, Rob Hansen, Kim Kuska, and Gary Lindquist. Many of the published reference I have found searching the internet, especially SORA.

The original list I am working from is A Checklist of the Birds of Tulare County, California, 1997 and 2005 versions.

Sp S F W

Anatidae

b Fulvous Whistling-Duck e e e e Dead Pig Pond, 9 October 2006 thru 29 April 2007, Tony Kurz: repeatedly observed and photographed by many. Raised young. Some questioned origin but most accepted record and it should be noted that the locally extirpated Bell's Vireo also made a reappearance in this wettest year in decades.

Pixley NWR, 29 April 2006, John Lockhart:
First record in 24 years, also seen by Kim Kuska, Steve Laymon, Steve Summers, photos, [posted <http://groups.yahoo.com/group/tularekingbirds/message/163>]

Creighton Ranch, 23-24 August 1982, Keith Hansen, Becky DeMonte:
[Note: Keith included a sketch of the 2 birds at the end of his field notes. In Keith's Aug. 1 to Nov. 30, 1982 report to American Birds, he mentioned that Bob Barnes, authority on Tulare County birds, said that this is the first good record for Tulare County in recent history. If the Sept. 28, 1940 record by Ward Minturn ("Tule River near Tulare Lake") was in Kings County, then this Aug. 23, 1982 record may be the first Tulare County record.] [Tulare County Rare (Exceptional) Bird Records, Rob Hansen]

28 September 1940, 2 birds at "Tule River near Tulare Lake" [this location may have been near Creighton Ranch- which is in Tulare Co. - or it may have been just inside Kings Co.] This was on a trip Ward Minturn took with Ed Hughson. [Tulare County Rare (Exceptional) Bird Records, Rob Hansen]

Least Bittern

s 82, 83, 98, sp 07

e e

Homeland Canal Lateral B, 25 May 2007, Steven Summers:
[posted <http://groups.yahoo.com/group/tularekingbirds/message/401>]

Kansas Ave Ponds, 26 July 1998, David Yee:

This adult least bittern was seen in what local birders call the Kansas Avenue ponds. This is Kaweah Delta Water Conservation District's Basin #17 (the SE ¼ of the SW ¼ of Section 6, Township 20 South, Range 23 East). The bird was in tules along the east side of this basin and was seen well for five minutes (0720-0725) by all participants in a Central Valley Bird Club trip to birding sites in the Tulare Lake Basin led by David Yee. Call notes (fide Allison Sheehey-Cunningham) were like green heron but repeated. [Tulare County Rare (Exceptional) Bird Records, Rob Hansen]

Creighton Ranch Preserve, 23 July 1983, Rob Hansen, Debra Hansen, and Becky DeMonte:

It was heard by all three observers [Tulare County Rare (Exceptional) Bird Records, Rob Hansen]

Creighton Ranch Preserve, 1-3 August 1982, Keith Hansen, Rob Hansen:

Keith's American Birds notes read as follows: "This little guy hung out for a while at Creighton Ranch giving many their first least bittern. Once I even saw it from [the Preserve residence] front porch while having my morning coffee". This individual was seen in marsh habitat inside the reservoirs in Section 34, Township 21 South, Range 23 East). [Tulare County Rare (Exceptional) Bird Records, Rob Hansen]

Creighton Ranch Preserve, 18 July 1982, Gary Page and Lynne Stenzel (visiting from PRBO):

Cathartidae

b California Condor

Historical

h h h h Historical

Well documented until capture of last free living individuals, Blue Ridge was a well know roost.

Two nests have been recorded in giant sequoias in the Sierra Nevada, Tulare County, and this may have been a regular occurrence for condors resident in this area (09).

CALIFORNIA CONDOR. Formerly more common and widespread. Still occurs regularly in Tulare Co. (where nesting was documented in 1950) and possibly in southern San Benito and Monterey Cos. Occasional in Fresno Co. and north to Santa Clara (1971), Tuolumne (1962), and Madera (1959) Cos. Recent district C records come from Santa Cruz (1973,1974) and Monterey (1971) Cos.

CALIFORNIA CONDOR. Extinct in the wild since 1987. Nested in Tulare Co. in 1984, and last seen there in fall 1986.

From BIRDS OF NORTHERN CALIFORNIA AN ANNOTATED FIELD LIST. Second Edition by Guy McCaskie, Paul De Benedictis, Richard Erickson, Joseph Morlan Designed and Edited by Nick Story for Golden Gate Audubon Society; Berkeley, California; Reprinted with Supplement, April 1988

Accipitridae

Mississippi Kite
s 83, f 05

Sp S F W

e e

Tule River at junction of Hwy 43 and Road 144, 5 October 2005, Mike San Miguel:
This morning I found a juvenile Mississippi Kite in southern Tulare County. It flushed from a large cottonwood tree along the Tule River just east of Highway 43 where it crosses the River. Heading north turn right immediately after crossing the Hwy 43 bridge about a mile south of Ave 144 or Highway 190. The cottonwoods are marked by a toy race car on the road under the tree. I watched the bird for 5-10 minutes before it dropped below the tree line. Listen for its thin down-slurred phee-eeuu vocalizations. The habitat is perfect and there are 1,000s of dragonflies in the vicinity so the bird could stick around the area.
Accepted by CBRC

Creighton Ranch Preserve, 10 June 1983, Rob Hansen:
I sketched the bird. The bird was seen flying north at a low altitude over "Little Marsh". My wife Debra (who had seen enough harriers to know this bird was not a Northern harrier) was the only other observer. Since she is not an active birder, I'm pretty sure that Calif. Rare Bird Records Committee authorities would say her corroboration doesn't "count". [Tulare County Rare (Exceptional) Bird Records, Rob Hansen]

Yesterday I birded with John Sterling, Tanner Easterla, and Steve
Summers. Next stop from there is Lake Success we had
one 1st cycle Thayer's Gull, Eurasian Wigeon, and a Red-breasted
Merganser. Our last stop of the day in Tulare County was the
Alpaugh Irrigation Pond. John and Tanner's Incredible birding
knowledge found us 7 Thayer's Gulls, and 2 of the 7 were adult's.
Steve mentioned this could be the first known record of adult
Thayer's in Tulare county. We missed the Glaucous Gull, but found 2
First cycle Glaucous-winged Gulls. It was a great day and I learned
so much.

Yesterday I birded with John Sterling, Tanner Easterla, and Steve Summers. We missed the Glaucous Gull, but found 2 First cycle Glaucous-winged Gulls.

Visalia, 28 November 2002, Rob Hansen:
glaucous-winged gull (I videotaped one as it flew over Ferguson between Akers and Demaree in Visalia on November 28, 2002...by brother Keith was the other observer). Here are the notes I jotted down about this record: The videotape clearly shows a dark billed, pale mocha-colored gull with a plain unmarked tail and uniformly plain (no contrast or pattern) underwing. [Email from Rob Hansen 9 Dec 2007]

Success Lake, 20 January 2002, Les & Cindy Lieurance:
video Les and I found the Glaucous-winged Gull at Lake Success on 20 January 2002. It was a first winter bird associating with Herring Gulls and California Gulls close to the boat ramp below North Campground. Les shot some videotape of the bird once we realized it was a first county record. We recall submitting a vhs tape to Bob Barnes. If we are wrong about that, or if Bob no longer has the videotape, Les could send a file to you via email, or if you prefer, on a vhs tape. Please let us know if you need further documentation. [email Cindy Lieurance]

Spotted Dove may now be extirpated from Tulare County. You might check with Rob. They are still found in Bakersfield and were found in Fresno and Porterville in the 1970s/1980s. [Email from Bob Barnes Oct 26, 2005]

Cuculidae

- B Yellow-billed Cuckoo e Yellow-billed Cuckoo - Lee Wilson had one in the 1970s at the Lindsay Grave Pits east of town.
Historical s 1919
- As a result of a report we are working on together, here is a brief part of an email message I got from Steve Laymon (one of the, if not THE, top yellow-billed cuckoo experts in California) yesterday. This is FYI to add to the info in you Tulare County "exceptional" bird species archive:
FYI, here are some details about the most recent yellow-billed cuckoo record in Tulare County. All I had heard about this record is that Father Lee Wilson, when he lived in Lindsay, had seen a yellow-billed cuckoo at the Lindsay "grave pits" between 1970 and 1985. I didn't know month(s), year, or any other details than that he saw one
As I recall my conversation with Lee Wilson, he did not find a nest of the yellow-billed cuckoo, but had a pair carrying food during the breeding season -- I have never seen cuckoos carrying food if they are not feeding young either in or out of the nest. Also, the observation was based on several visits over several weeks or a month or more. Lee Wilson had detailed notes, and I tried to get him to get them out and send me a copy, but he said that it was "too much trouble." He was pretty old at that point & died a year or so later, so he was probably right - it was "too much trouble!"
Until I heard these details from Steve, I did not realize that Lee had observed nesting behavior. This cuckoo record is one reason that the Tulare Basin Wildlife Partners has prioritized the Lewis Creek riparian habitat (east of Lindsay) as a priority conservation/protection site in Tulare County. Wish us luck.
Rob [per email Rob Hansen Feb 11, 2008]

five miles west of Earlimart, 25 December 1999, John Lindfors:
[posted http://groups.yahoo.com/group/central_valley_birds/message/335]

What a surprise Mr. Lockhart!
Who would believe that my afternoon outing would become a record! I remember that experience on Christmas day well. I took my wife Janice Lindfors and my mother-in-law Alice Wortman, who was visiting with us up to Earlimart because there was the chance of seeing Sandhill Cranes. I vividly remember at carefully checking the grassy edges of both sides of the road and barbed wire fences and wooden posts for birds.

When I saw the flycatcher, I ruled out the Western Kingbird because of the dark color of the back and head and thought it must be a Black Phoebe. But everything changed when I saw the breast which had a "vest-like appearance" with white being on the breast and throat. I have seen Olive-sided Flycatchers and this bird was not large enough both in overall size and in the length of its bill. There were no "cotton tufts" either. OSFLs perch on bare branches up high (in my experience anyway) not on fences near water. Finally, the bird wagged its tail like EAPHs do.

Both Janice and I have lived most of our lives on the east coast and are well aware of Eastern Phoebes.

Regards,
John Lindfors [email John Lindfors]

Cutler Park, 24 August 1989, Rob Hansen:
Least Bell's vireo, listed as State and Federally Endangered, was once the most abundant breeding songbird in Central Valley riparian habitat. I heard, then saw a single male Bell's vireo on August 24, 1989 (R. Hansen, field notes) as it sang and foraged in Valley oak riparian forest and willow scrub at Cutler Park, (on the south edge of St. Johns River). This obligate riparian breeder has been extirpated from this area as a nesting bird (Bell's vireo has not been reported as a breeding species in the southern San Joaquin Valley) since the 1950's because of cowbird parasitism and habitat loss. Because of the date, I assume that the individual seen at Cutler Park was probably a post-breeding male that had already nested somewhere else in California that year. [Tulare County Rare (Exceptional) Bird Records, Rob Hansen]

Mabel is likely now deceased. She was still alive a couple of years ago in her 90s. She was
a major contributor to Audubon Field Notes and American Birds, predecessors to the current
North American Birds. She lived on a small ranch just above Springville and had a cabin at
Roger's Camp above Camp Nelson and between Black Mountain and Solo Peak. Mabel
Mires was a highly respected birder by the likes of those such as Rich Stallcup, who was
once considered one of America's (and by extension
California's) top birders. [email Bob Barnes]

Parulidae

Golden-winged Warbler
197?

e Kaweah Oaks Preserve, May or June late 1970- early 1980, Lee Wilson:
The Golden-winged Warbler is a late May or June record from Kaweah Oaks Preserve by
Lee Wilson in the late 1970s, early 1980s - within a year or two of its establishment by TNC
and when Lee was going out there one or two times a week for birding and photography. If
someone has copies of old Tulare County AS newsletters, the exact date may be found
there. I have moved too many times and have too many boxes in too many storage
locations to know exactly where mine are. Lee is now deceased. His birding ability and
accuracy was excellent. But, he did not share his sightings in a timely manner. This sighting
can be narrowed down by finding out when Kaweah Oaks Preserve was established and
when Lee left Tulare County for the Kern River Valley. Then, the minutes from Tulare
County Audubon Society BOD meetings and newsletters can be reviewed for the exact date
of the observation. [email Bob Barnes]

Springville CBC, 16 December 1989, Springville CBC:

Springville CBC, 17 December 1977, Springville CBC:

Harris's Sparrow ...

John Wilson on a Springville CBC on the River Ranch off the upper end of Globe Drive. I bet
he has note if you want to track it down. So do I ... in storage! This would have been the
1980s bird.

Mabel Mires

Carol Lapham at least two different years ... I saw them both. I think the other, earlier 1970s
CBC record is one of these.

Camilla Gunderson at her yard off Worth Road in Porterville (south of the college). I saw this
one, too. I am confident this was submitted to American Birds.

Lapland Longspur
f 1999

e Herbert Wetland Prairie Preserve, 26 November 1999, Keith Hansen, Rob Hansen:
On November 26, 1999 (1320-1345 hours) Rob Hansen, Keith Hansen, John Silvas, and
Patricia Briceno saw 4 LALO and 2 CCLO (RH field notes contain sketches and plumage
notes) on fallow land among a horned lark (HOLA) flock just E of (and on and over) HWPP.
Keith and John heard the LALO calls and all 4 observers heard CCLO calls. Tulare County
Rare (Exceptional) Bird Records, Rob Hansen]

Emberizidae

Chestnut-collared Longspur
w-sp88 sp94, f 99, w1, 2

e e e Herbert Wetland Prairie Preserve, 1 December 2002, Rob Hansen, Kim Kreitinger:
Rob Hansen and Kim Kreitinger saw 2 CCLO (possibly as many as 6 birds) just E of (and on and over) HWPP between 1030 and 1100 on December 1, 2002. These birds were also in among HOLA on fallow land but they also were seen flying away from annual grassland on HWPP. [Tulare County Rare (Exceptional) Bird Records, Rob Hansen]

Herbert Wetland Prairie Preserve, 29 November 2002, Carole Combs, Rob Hansen:
Rob Hansen and Carole Combs saw 3 CCLO just E of (and on and over) HWPP between 1020 and 1033 on November 29, 2002. These birds were also in among HOLA (tens of birds were in the flock...fewer than 100 total) and American pipits on fallow land but they also landed in annual grassland on HWPP. [Tulare County Rare (Exceptional) Bird Records, Rob Hansen]

Atwell Island Project, 19 December 2001, Steve Laymon:
Section 3, being chased by dog (Pit Bull) [email Steve Laymon]

Herbert Wetland Prairie Preserve, 26 November 1999, Patricia Briceno, Keith Hansen, Rob Hansen, John Silvas:
On November 26, 1999 (1320-1345 hours) Rob Hansen, Keith Hansen, John Silvas, and Patricia Briceno saw 4 LALO and 2 CCLO (RH field notes contain sketches and plumage notes) on fallow land among a horned lark (HOLA) flock just E of (and on and over) HWPP. Keith and John heard the LALO calls and all 4 observers heard CCLO calls. [Tulare County Rare (Exceptional) Bird Records, Rob Hansen]

Herbert Wetland Prairie Preserve, 5 March 1994, Rob Hansen:
One chestnut-collared longspur was seen near the middle of the Herbert Wetland Prairie Preserve (HWPP) between Lindsay and Tulare on Highway 137 (between 1425-1430 hours) on 5 March 1994; this was the first record of this species from the Valley floor of Tulare County. This longspur's flight call, "kittle", was heard each of the four times it flushed from grass that stood 6-12" tall on this fairly windy day. Its presence was recorded on videotape just as the first sprinkles of a storm began to fall. The fact that this rare species showed up at the 725-acre grassland/vernal pool ecosystem suggests that subtle habitat features on this "island" of natural vegetation are attractive, even to such a locally rare species. [Tulare County Rare (Exceptional) Bird Records, Rob Hansen]

Lewis Hill, 28 February thru 3 April 1988, Rob Hansen:
The first record of this species in Tulare County pertains to a flock of 50-60 chestnut-collared longspurs that were present from February 28 to April 3, 1988 in clay-soil grasslands on the north side of Lewis Hill...in the low foothills just NE of Porterville (Rob Hansen field notes). [Tulare County Rare (Exceptional) Bird Records, Rob Hansen]

Chimney Creek between campground and boarder, ? June ,Bob Barnes:
Indigo Bunting - Based on your listing of Exceptional species, Indigo Bunting definitely fits in. The two of the sightings of mine that come quickly to mind are one of a singing male in the Tule River (North Fork) riparian area on the left along Balch Park Road about one mile above Yokohl Valley Road and another singing male in the Chimney Creek riparian area 100' or so above its crossing under the Chimney Peak National Back Country Byway. [email Bob Barnes]

Icteridae

Bobolink
f 2006

e

Hebert Preserve, 6 September 2006, Rob Hansen:
I found an immature bobolink (first record for Tulare County) at the Herbert Wetland Prairie Preserve on September 6, 2006 (6:53 - 6:55 pm).
I was birding on my own and did not get any video or still shots but I took detailed field notes immediately after viewing the bird from about 45 feet through my 10X Nikon binoculars and a 32X Leica spotting scope.

e e

Locally Rare probably breeding on SE boarder of Tulare CO

Chimney Peak Campground 22 June 2007, Bob Barnes
4-7 Scott's Orioles with Los Angeles AS field trip and 4-5 along Kennedy Meadows Road including a pair near Big Pine Meadow. Amazing! We were able to hear 4 singing males at once. We thought there were seven birds about. [email Bob Barnes]

Chimney Peak Scenic Byway and county line, 26 May 2007, Tony Kurz, John Lockhart, Justin Ward: photos [posted <http://groups.yahoo.com/group/tularekingsbirds/message/405>]

Kennedy Meadows, (week 1) May 2007, Wes Fritz:
23 Apr-23 May 07 SE TULARE COUNTY (SETC) BIRDS PLUS SOME OTHERS: SCOTT'S ORIOLE - a report by Wes Fritz of a male in the burn area along Kennedy Meadows Road just east of the "Welcome to Kennedy Meadows" sign the first week of May is the only one encountered in eight SETC visits. This is the farthest north record of this species into Tulare County of which I am aware. [email Bob Barnes posted by John Lockhart <http://groups.yahoo.com/group/tularekingsbirds/message/404>]

Chimney Peak Scenic Byway, 14 June 2006, Bob Barnes, Debby Crain, John Lockhart, Justin Ward:

Scott's Oriole (singing male at junction of the CPNB By-way and Long Valley Road, 1.5 miles air miles north of Lamont Peak Trail at the county line where Steve Summers observed this species in May), [email Bob Barnes posted by Alison Sheehy <http://groups.yahoo.com/group/tularekingsbirds/message/191>]

Chimney Peak Scenic Byway and county line, 15 May 2006, Steve Summers:

I had the Scott's Orioles on May 15. Two singing males at the Lamont Pk. trailhead which I've determined through topo maps is about 120 ft. inside Tulare Co. They are probably regular here or nearly so I would guess. I had them on the way up the grade in Kern Co. also. Another place they get close to Tulare is in Inyo Co. on Nine Mile Canyon Rd. I had several here also on the same day so they might spill over there also in the pinyon pines at the crest just into Tulare Co. At any rate I'm thinking they may be somewhat regular, at least in the Lamont Pk area. [email Steve Summers]

Chimney Peak Area, 1992, John Sterling:

I had seen Scott's Oriole there back in 1992 and felt that it was probably a regular breeder bird at that location based upon the habitat and the number of them in the general area. Perhaps they are not annual? But it wouldn't surprise me if they were there most if not every year. [posted by John Sterling <http://groups.yahoo.com/group/tularekingsbirds/message/190>]

SCOTT'S ORIOLE. Three additional records: in district C at pt. Reyes, Marin Co., May 28, 1982, and in district M near Chimney Peak, Tulare Co., spring/summer 1980, and July 4, 1987.
