CHAPTER 3 METHODS OF ANALYSIS
   K-Ar Radiometric Dating 66
   Microprobe Analysis 67
   XRF Analysis 68
   INAA Analysis 69
   Helium Isotopic Analyses 72
   Modeling Programs 74

CHAPTER 4 PETROGRAPHIC, GEOCHEMICAL AND GEOCHRONOLOGICAL DATA FOR EYJAFJÖLL
   Stratigraphy 76
   Major and Trace Element Data 81
   Petrography 95
      Groundmass 95
      Vesicles 98
      Phenocrysts 98
         PLAGIOCLASE 99
         CLINOPYROXENE 99
         OLIVINE 102
         TITANOMAGNETITE 102
         CUMULATE ROCKS 105
   Mineral Compositions 106
      PLAGIOCLASE 106
      CLINOPYROXENE 110
      OLIVINE 110
      TITANOMAGNETITE 110
      GLASS 113
   Isotopic Compositions 113

CHAPTER 5 INTERPRETATION AND DISCUSSION OF GEOCHEMISTRY, GEOCHRONOLOGY, AND TECTONICS OF THE EYJAFJÖLL VOLCANIC SYSTEM
   Geochemistry 114
      Mineral Data - Magma Dynamics 114
      Chemical Data - Crystallization Models 119
LIST OF FIGURES

Figure 1.01: Map of Iceland, showing Eyjafjöll (topped by a glacier), Vestmannaeyar, and Reykjavik.

Figure 1.02: Map of Iceland showing the distribution of volcanism according to age, from the Tertiary to present.

Figure 1.03: Map of Iceland showing the active volcanic and tectonic zones: Reykjanes Ridge (RR), Kolbeinsey Ridge (KR), Tjörnes Fracture Zone (TFZ), Northern Rift Zone (NRZ), Eastern Rift Zone (ERZ), Southeastern Volcanic Zone (SEVZ), Western Rift Zone (WRZ), Snæfellsnes Volcanic Zone (SVZ), Mid-Iceland Transform Zone (MITZ), South Iceland Seismic Zone (SISZ).

Figure 1.04: Block diagram illustrating the topographic expression of various types of dilational structures seen in the active volcanic zones of Iceland.

Figure 1.05: A photograph of a laboratory starting convective plume showing the structure caused by conduction of heat and consequent entrainment of surrounding fluid.

Figure 1.06: A model of the evolution of Sr ratios with time, assuming that half the Earth's mantle has had its low-melting constituents extracted to give the equivalent of a 50 km thick crust, (from Hall, 1987).

Figure 1.07: Plot of Sr ratios against Nd ratios for basaltic lava suites, (from Hall, 1987).

Figure 1.08: Graphical representation of the Holmes-Houtermans model.

Figure 1.09: Isotope ratios of Pb from young volcanic rocks.

Figure 1.10: Reconstruction of the North Atlantic at magnetic anomaly C23, just after the onset of sea-floor spreading.

Figure 1.11: The morphology of the Greenland-Scotland ridge (from Bott, 1981).
Figure 1.12: Cross section lines for figures 1.13 and 1.14.

Figure 1.13: Cross-sections spanning latitude range from 63.0°N to 66.0°N, from NW to SE (A-A') and from SW to NE (B-B).

Figure 1.14: Generalized crust and upper mantle cross-section derived from the RRISP main profile.

Figure 1.15: Major and trace element variation within Iceland (Elliott et al., 1991).

Figure 1.16: Pb and Nd variation within Iceland.

Figure 1.17: Schematic representation of normal ridge (A) and propagating ridge (B) transform intersections.

Figure 1.18: Southeastern Volcanic Zone (SEVZ), with the volcanic systems (dotted fields) of Hekla, Vatnajökull, Torfajökull, Tindfjöll, Eyjafjöll, Katla, and Vestmannaeyjar (after Jakobsson, 1979).

Figure 1.19: The South Iceland Seismic Zone (SISZ) and the Southeastern Volcanic Zone (SEVZ) showing mapped surface breaks and regions in which over half of the buildings were destroyed in historic seismic events.

Figure 1.20: Bookshelf faulting.

Figure 1.21: Depth to the lower crust (layer 3) in Iceland (in km).

Figure 1.22: Development of the present geometry of the tectonically active zones in Iceland.

Figure 1.23: Some major identified magnetic anomaly lineations in the ocean surrounding Iceland (from Björnsson, 1981).

Figure 2.01: The silica contents of the initial gas-rich products of historic eruptions from Hekla tend to be higher than those of the main basaltic magma that follows, and the amount of this difference is directly proportional to the time of repose between eruptions.
Figure 2.02: Eyjafjöll Volcanic System - Geology (modified from Jakobsson, 1979, and Jón Jónsson, 1988).

Figure 2.03: $^3$He/$^4$He values for different regions within Iceland.

Figure 2.04: La/Sm histograms for different volcanic regions.

Figure 2.05: $^{87}$Sr/$^{86}$Sr histograms for different regions within Iceland.

Figure 2.06: Pb-Pb diagrams for Recent and Tertiary volcanics from Iceland.

Figure 2.07: Nd ratios versus Sr ratios for both Recent and Tertiary volcanics from Iceland (from Meyer et al., 1985).

Figure 2.08: Mineralogical variations along the southern neovolcanic zones.

Figure 2.09: The location of drillholes used to determine thermal gradients in Iceland.

Figure 2.10: Geothermal gradients in Iceland and their relationship to the pyrolite solidus.

Figure 2.11: P-T diagram for partial melting of pyrolite, indicating compositions of liquids generated.

Figure 2.12: Schematic diagram of southern volcanic zones in Iceland illustrating magma genesis and evolution (from Meyer et al., 1985).

Figure 2.13: Model of magma generation and accumulation along the SEVZ.

Figure 4.01: Eyjafjöll Volcanic System.

Figure 4.02: Eyjafjöll Volcanic System - Geology (modified from Jakobsson, 1979, and Jón Jónsson, 1988).
Figure 4.03:
Approximate stratigraphy of lowest portion of Steinafjall sampling section.

Figure 4.04:

Figure 4.05 (a-m):
Major (a-h) and trace (i-m) element variation diagrams, with data for the Eyjafjöll Volcanic System.

Figure 4.06:
Eyjafjöll data according to the IUGS classification from LeBas et al. (1986).

Figure 4.07:
Alkali vs. silica diagram for Eyjafjöll samples.

Figure 4.08:
AFM diagram for Eyjafjöll data with tholeiite and alkaline trends from Irvine and Baragar (1972).

Figure 4.09:
A segment of the basalt tetrahedron with Eyjafjöll data (all samples with SiO2 < 55 wt%).

Figure 4.10:
FeO vs. TiO2 for all Eyjafjöll samples with SiO2 < 55 wt%.

Figure 4.11:
Chondrite-normalized REE patterns for Eyjafjöll samples.

Figure 4.12:
Thin section of Ey-10 showing plagioclase phenocryst with different zoning geometries (XPL).

Figure 4.13:
Thin section of Ey-29 showing plagioclase phenocryst with small clinopyroxene and opaque inclusions.

Figure 4.14:
Thin section of Ey-39 showing two clinopyroxene phenocrysts growing together (PPL).

Figure 4.15:
Thin section of Ey-36 showing olivine phenocryst with remnants of rounded glass inclusion (0.4 mm across).

Figure 4.16:
Microprobe analysis from core to rim of a plagioclase phenocryst from Ey-10.
Figure 4.17: Pyroxene triangle showing averages of clinopyroxene phenocryst compositions for all Eyjafjöll samples.

Figure 4.18: Thin section of Ey-1 showing titanomagnetite phenocryst (reflected light).

Figure 5.01: Representative olivine phenocrysts from Ey-17, showing three different core compositions.

Figure 5.02: Representative plagioclase phenocrysts from Ey-10, showing multiple core compositions and zoning types.

Figure 5.03 (a-m): Major (a-h) and trace (i-m) element variation diagrams, including data for the Eyjafjöll Volcanic System, and trends for a perfect fractional crystallization model (MIXNFRAC) at the NNO buffer and QFM buffer.

Figure 5.04: Change in density during crystallization of parent magma (Ey-49) at the NNO buffer.

Figure 5.05: Ti vs. Al (cation mole fraction) for experimental clinopyroxenes from Vestmannæyar study (Thy, 1991a).

Figure 5.06: Ti vs. Al (cation mole fraction) for clinopyroxenes from Eyjafjöll data (full range of Ti data).

Figure 5.07: Ti vs. Al (cation mole fraction) for clinopyroxenes from Eyjafjöll data (limited range of Ti data).

Figure 5.08: Chondrite-normalized REE patterns for Eyjafjöll samples.

Figure 5.09: Chondrite-normalized REE patterns for Ey-4 and STF-3 (representing the highest and lowest abundances for Eyjafjöll).

Figure 5.10: Nb and Zr variations for Eyjafjöll data combined with modeled fractional crystallization trend.

Figure 5.11: Incompatible element patterns for Eyjafjöll samples, normalized to normal MORB (NMORB) concentrations.
Figure 5.12: Compositions for mantle melts at different starting compositions and pressures (depths of melting).

Figure 5.13: Model of magma generation and accumulation along the SEVZ.

Figure 5.14: A segment of the basalt tetrahedron with Eyjafjöll data sorted according to age.

Figure 5.15: Alkali vs. silica diagram with Eyjafjöll data sorted according to age.

Figure 5.16: Accumulation rates for lavas on Eyjafjöll throughout known volcanic history.

Figure 5.17: Alkali vs. silica diagram for data from Eyjafjöll, with fields corresponding to data from Hekla, Katla, and Vestmannaeyjar.

Figure 5.18: A segment of the basalt tetrahedron with data from Eyjafjöll and fields corresponding to data from Hekla, Katla, and Vestmannaeyjar.

Figure 5.19: Chondrite-normalized REE patterns for samples from Eyjafjöll, the Hekla-Katla region, and Vestmannaeyjar.

Figure 5.20: Idealized cooling paths for crustal magma bodies.
LIST OF TABLES

Table 1.01: Buoyancy, volume, and magma volume fluxes for specific hotspot localities throughout the world.

Table 3.01: Precision of XRF analysis.

Table 3.02: Accuracy of XRF analysis.

Table 3.03: Standard analyses and associated error for INAA accuracy.

Table 4.01: Eyjafjöll stratigraphy.

Table 4.02: Microprobe data.

Table 4.03: Representative analyses from microprobe analysis.

Table 5.01: Chemical effects of magma mixing and crystal accumulation.

Table 5.02: Compositions of a spinel lherzolite (Kushiro et al., 1968), most evolved possible parent magma from MIXNFRAC fractional crystallization model (liquid just before plagioclase crystallization begins, 1187°C), and most primitive possible parent magma, from same model (Ey-49).
LIST OF APPENDICES FIGURES

Figure D.01 (a-f):
Microprobe transects of plagioclase phenocrysts.

Figure D.02 (a-g):
Microprobe transects of olivine phenocrysts.
LIST OF APPENDICES TABLES

Table B.01: Major and trace element data from XRF analysis. 193
Table B.02: CIPW norms, and equilibrium olivine data. 200
Table B.03: Ta, Hf, and REE data from INAA. 205
Table B.04: K-Ar ages and 3He/4He values. 206
Table C.01: Thin section petrography. 208
Table D.01: Representative analyses of plagioclase phenocrysts from Microprobe Analysis. 217
Table D.02: Representative analyses of olivine phenocrysts from Microprobe Analysis. 223
